Video Games as Educational Tools in Business, Trade, and Management

1) Chosen Profession: Business & Management

In the **business and management** profession, decisions around strategy, finance, operations, and human behavior have high real-world consequences. Serious video games provide a **sandbox for strategic thinking**, allowing learners to experiment with business models, market dynamics, and leadership choices without financial or reputational risk. Drawing on Module 6 concepts, business-oriented serious games effectively blend learning, wellbeing, and engagement.

2) Serious Game Examples & Game Mechanics

Two well-known examples are **SimCity** and **Capitalism II**.

SimCity

- **Mechanics:** Resource allocation, budgeting, taxation, long-term planning, and crisis management.
- **Game Elements:** Feedback loops (profit/loss, citizen satisfaction), progressive complexity, and cause–effect systems.
- **Serious Design:** Players act as city managers, balancing economic growth with public wellbeing—mirroring real-world managerial trade-offs.

Capitalism II

- **Mechanics:** Market competition, supply-chain management, pricing strategies, R&D investment, and corporate expansion.
 - **Game Elements:** Data dashboards, competitive AI firms, profit metrics, and strategic decision cycles.
 - **Serious Design:** Closely models real capitalist markets, making it particularly valuable for teaching economics, entrepreneurship, and corporate strategy.
-

3) Benefits of Serious Games in Business Education

a) Skill Transfer and Experiential Learning

Business games foster **systems thinking**, a critical managerial skill. Players learn how decisions in marketing, finance, and operations interact. For example, poor pricing decisions in Capitalism II directly impact demand and profitability, reinforcing real-world economic principles. This supports **near and far skill transfer**, as learners apply strategic reasoning to real business cases.

b) Motivation – Self-Determination Theory (SDT)

Serious games strongly satisfy SDT's three psychological needs:

- **Autonomy:** Players choose strategies, industries, and growth paths.
- **Competence:** Continuous feedback (profits, rankings, city ratings) builds mastery.
- **Relatedness:** Competitive or comparative elements create social benchmarking and professional identity.

This intrinsic motivation often surpasses traditional lectures or static case studies.

c) Immersion – Flow Theory

Both SimCity and Capitalism II create **Flow** by matching challenge with player skill. As learners improve, the games increase complexity—new markets, competitors, and crises—keeping engagement high. This immersion enhances concentration, reduces learning anxiety, and supports wellbeing by making learning feel purposeful and enjoyable.

d) Reinforcement Theory

Repetition is central to business games. Players repeatedly test strategies, receive immediate feedback, and adjust decisions. Profitable strategies are reinforced, while failures (bankruptcy, declining market share) act as corrective signals. This trial-and-error loop strengthens decision-making confidence and resilience.

4) Limitations and Ethical Concerns

- **Simplified Reality:** Business games often reduce complex human, cultural, and regulatory factors, risking oversimplified mental models.
- **Ethical Blind Spots:** Profit-maximization mechanics may underemphasize ethics, sustainability, and social responsibility.
- **Transfer Risk:** Success in-game may not fully translate to real-world uncertainty, emotional pressure, or organizational politics.
- **Access Inequality:** Advanced simulations may not be equally accessible to all learners or institutions.

5) Recommendations for Improvement

1. **Ethics & Sustainability Layers:** Embed ESG (Environmental, Social, Governance) consequences into scoring systems.
2. **Adaptive AI Markets:** Use AI-driven competitors that react realistically to player behavior.
3. **Hybrid Learning Models:** Combine games with real case discussions and reflective assignments to strengthen transfer.
4. **Multiplayer & Team Modes:** Simulate leadership, negotiation, and conflict management within teams.
5. **Assessment Alignment:** Map in-game outcomes to formal business competencies (strategy, finance literacy, risk management).

Conclusion

Serious video games like SimCity and Capitalism II transform business education from **theoretical learning to lived experience**. By leveraging motivation (SDT), immersion (Flow), and repetition (Reinforcement Theory), they develop strategic thinking, confidence, and decision-making skills. While not replacements for real-world practice, they are powerful complements—preparing future managers and entrepreneurs to think systemically, act ethically, and perform confidently in complex business environments.
